OBJECTIVE

Motivated B.Tech ECE 2nd-year student with strong foundations in Python, C, and C++ seeking a software internship to apply programming skills to real-world development, automation, and backend problem-solving.

EDUCATION

Maharaja Agrasen Institute of Technology (MAIT), GGSIPU, Delhi **2024 – Present**
Bachelor of Technology (B.Tech) in ECE – Advanced Communication Technology *Expected Graduation: 2029*

TECHNICAL SKILLS

Languages:	Python, C, C++, Bash, JavaScript, SQL, HTML/CSS
Web & APIs:	Flask, REST APIs, WebSockets, Telegram Bot API, Discord API, OpenRouter / LLM APIs
Security & Pentesting:	Vulnerability Assessment, Web Application Security (OWASP Top 10), OSINT Automation, Network Packet Inspection (Wireshark), API Security Testing, MCP Dynamic Fuzzing
Tools & Platforms:	Linux/Unix, Git, GitHub, Docker, VS Code, Postman
Hardware & Embedded:	ESP32, Microcontroller Interfacing, Hardware Protocols

FEATURED PROJECTS

MCP Sentinel – Security Scanner for MCP Servers & AI Agents [GitHub](#)
Tech: Python, Security Auditing, AST Analysis, Fuzzing

- Designed and developed an automated dynamic security scanner and linter for Model Context Protocol (MCP) servers and AI agent toolchains.
- Built detection modules for Path Traversal, Command Injection (RCE), SSRF, Secret/Credential Leaks, and Unicode Tag Smuggling.
- Automated payload generation and security policy verification to prevent prompt injection and tool misuse vectors.

Evil-AI (VADER-GEM) – Production LLM Telegram Bot & Persona Engine [GitHub](#)
Tech: Python, AsyncIO, OpenRouter API, NVIDIA Nemotron, Docker, React/Ink TUI

- Built an asynchronous, multi-user AI Telegram bot and terminal TUI powered by NVIDIA Nemotron via OpenRouter API.
- Implemented per-user conversational memory, real-time response streaming, and custom persona injection engines.
- Engineered production resilience with 15+ error handlers, exponential backoff retries, rolling-window rate limiting, and Docker orchestration.

Cafe-Hunter – Automated Vulnerability & Intelligence Bot [GitHub](#)
Tech: Python, Discord API, Threat Intel, Web Automation

- Engineered an automated Discord assistant that monitors codebases and threat intelligence feeds for vulnerability disclosures.
- Implemented asynchronous scraping and filtering workers to deliver prioritized alerts directly to researcher channels.

Portable Crosshair-X – App Portability & API Emulation Engine

[GitHub](#)

Tech: Binary Analysis, DLL Emulation/Hooking, Win32 API, Systems Packaging

- Analyzed application runtime dependencies to integrate an offline DLL emulation layer (`steam_api64.dll`), decoupling external client requirements.
- Packaged a self-contained, zero-installation distribution pipeline with automated AppID routing and isolated configuration states.

VaderStore – Web Dashboard & Valorant Store Checker

[GitHub](#)

Tech: Python, Flask, REST APIs, OAuth 2.0, HTML/CSS, Railway

- Developed a full-stack Flask web application to query daily rotating store items, Night Market offers, and account balances via Riot OAuth.
- Implemented multi-region support across AP, NA, EU, KR, and LATAM with secure session handling and real-time API integrations.
- Built a responsive dark-themed user interface and automated one-command cloud deployment pipeline using Railway.

AREAS OF INTEREST & ACTIVITIES

- **Offensive Security & Bug Hunting:** Active exploration of web security logic flaws, parameter tampering, and OSINT automation.
- **Open Source & Tooling:** Building open-source security tools, bots, and system utilities on GitHub.
- **Hardware Security & Networking:** Experimentation with microcontrollers, hardware protocols, and network packet analysis.
